3 Tests of Authentication

- **Infra-red Ink.**
- **I.R.P.S.**
- **Holographic Metal Band.**

MONETEC™ Market leader in the automatic authentication of bank notes.

MONETEC™

COUNTERFEIT BILL DETECTOR MERCURE

A portable, autonomous apparatus, **Mercure** provides rapid detection of forged banknotes (in less than one half a second) with a very high success rate. With three identification tests (InfraRed Ink, I.R.P.S. ⁽¹⁾, Holographic Metal Band), it is the only portable apparatus on the market which can analyse the bank note with such precision. Using the latest technology, **Mercure** is also the only apparatus in this price range whose software can be fully updated from the Internet, whereas other comparable machines can only change a few parameters.

This essential characteristic provides **Mercure** with capacities of **evolution and performance** through the possibility of downloading new software versions to keep up with the progress of forgers.

You simply place the measuring window against the white part of the banknote and press on the button, apply your detector lengthwise on the bill, and the result is given automatically by lights and a sound signal (which can be disconnected).
